EQUIPO DE TRABAJO

RESPONSABLES TÉCNICOS

Valeria Rojas Osorio, Médico Neuropediatra

Jefa, Programa de Trastorno del Espectro Autista, Hospital Gustavo Fricke, SSVQ, Chile.

Profesora Auxiliar, Escuela de Medicina, Universidad de Valparaíso, Chile.

Claudia Amarales, Médico Neuropediatra

Jefa, Unidad de Neuropediatría, Hospital Carlos Van Buren, SSVSA, Chile.

Profesora Auxiliar, Escuela de Medicina, Universidad de Valparaíso, Chile.

EQUIPO DE SÍNTESIS DE EVIDENCIA

Nicolás Meza Concha MSc(c), Médico Cirujano

Investigador Asociado, Centro Interdisciplinario de Estudios en Salud (CIESAL), Universidad de Valparaíso, Chile.

Miembro, Centro Asociado de la Universidad de Valparaíso, Cochrane Chile.

Profesor Asociado, Escuela de Medicina, Universidad de Valparaíso, Chile.

Eva Madrid Aris PhD, Médico Cirujano

Directora, Centro Interdisciplinario de Estudios en Salud (CIESAL), Universidad de Valparaíso, Chile.

Directora, Centro Asociado de la Universidad de Valparaíso, Cochrane Chile.

Profesora Titular, Escuela de Medicina, Universidad de Valparaíso, Chile.

Juan Victor Ariel Franco MSc PhD(c), Médico de Familia

Profesor Asociado, Instituto Universitario Hospital Italiano de Buenos Aires, Argentina.

Profesor Asociado, Universidad Nacional de la Matanza, Argentina.

Director, Centro Asociado del Instituto Universitario Hospital Italiano de Buenos Aires, Cochrane Argentina.

Miembro, *Governing Board*, Cochrane.

Camila Escobar Liquitay

Reference Manager, Biblioteca Central, Instituto Universitario Hospital Italiano de Buenos Aires, Argentina.

Information specialist executive (documentalista), *Cochrane Information Specialist Executive*, Cochrane.

ASISTENTES DE INVESTIGACIÓN

Francisca Aguilera Johnson, Médico Cirujano

CESFAM Juan Bautista Bravo Vega, Villa Alemana, Chile.

Ignacio Pérez Carrasco, Interno de Medicina

Interno de Séptimo Año, Escuela de Medicina, Universidad de Valparaíso, Chile.

Ayudante, Cátedra de Medicina Basada en la Evidencia, Escuela de Medicina, Universidad de Valparaíso, Chile.

Constanza Garrido, Residente de Neuropediatría

Programa de Especialización en Neuropediatría, Escuela de Medicina, Universidad de Valparaíso, Chile.

Leonardo Leal, Residente de Neuropediatría

Programa de Especialización en Neuropediatría, Escuela de Medicina, Universidad de Valparaíso, Chile.

Gabriela Pérez, Residente de Neuropediatría

Programa de Especialización en Neuropediatría, Escuela de Medicina, Universidad de Valparaíso, Chile.

MÉTODOS

DEFINICIÓN DE LOS CRITERIOS DE ELEGIBILIDAD

Se incluirán revisiones sistemáticas de ensayos clínicos aleatorizados que evalúen el efecto de las intervenciones no farmacológicas y farmacológicas de interés para niños ≤ 12 años con trastorno del espectro autista (de acuerdo al DSM-5, CIE-10 o cualquier criterio diagnóstico bien establecido), incluyendo el síndrome de Asperger, trastorno generalizado del desarrollo—no especificado de otra manera, trastorno autista, entre otras denominaciones.

No se considerarán como criterios de exclusión el idioma, año de publicación ni el formato de publicación (carta al editor, correspondencia, posters o publicación en revista biomédica).

Las intervenciones de interés, definidas en conjunto con la contraparte ministerial, son:

- No farmacológicas:
 - *Applied Behaviour Analysis (ABA)*
 - *Early intensive behavioral intervention (EIBI)*
 - *DIR/Floortime*
 - *Relationship Development Intervention (RDI)*
 - *Focused Playtime Intervention (FPI)*
 - *P.L.A.Y. (Play & Language for Autistic Youngsters)*
 - *Caregiver Skills Training program (CST)*
 - *Video-feedback Intervention to promote Positive Parenting adapted to Autism (VIPP-AUTI)*
 - *Cognitive Behavioural Therapy (CBT)*
 - *PROMPT (Prompts for Restructuring Oral Muscular Phonetic Targets)*
 - *Picture Exchange Communication System (PECS)*
 - *TEACCH Autism Program (Treatment and Education of Autistic and Communication-Handicapped Children)*
 - *Sensory Integration Interventions*
 - *Naturalistic Developmental Behavioural Interventions (NDBI)*
 - *Pivotal Response Treatment (PRT)*
 - *Early Start Denver Model (ESDM)*
 - *Joint Attention, Symbolic Play Engagement and Regulation (JASPER)*
 - *ImPACT (Improving Parents as Communication Partners)*
- Farmacológicas:
 - Risperidona
 - Aripiprazol

Para su elegibilidad, se considerarán estudios que evalúen el uso de risperidona y/o aripiprazol administrados vía oral, a cualquier dosis y duración del tratamiento, independiente de la

presencia de intervenciones concomitantes. A su vez, se incluirá cualquier revisión sistemática de ensayos clínicos aleatorizados que analice al menos una de las intervenciones no farmacológicas previamente enumeradas, independiente de su forma de ejecución, implementación y presencia de co-intervenciones. En relación a los grupos control, contemplaremos estudios que comparen la intervención de interés contra placebo, no-tratamiento, u otras intervenciones (*i.e.*, estándar de cuidado, según lo definido por los autores de cada estudio).

Los desenlaces a analizar, definidos en conjunto con la contraparte ministerial, son:

- Severidad de los síntomas de autismo
- Comportamiento repetitivo o restrictivo
- Procesamiento sensorial
- Lenguaje
- Comunicación social
- Funcionamiento social
- Problemas de comportamiento
- Habilidades de la vida diaria

Para identificar la correspondencia de estos desenlaces con las distintas escalas e instrumentos de medición utilizados en estudios previos, nos basaremos en un informe del NHS obtenido a través de la plataforma de COMET-initiative para los Core Outcomes Sets (COS) [1].

Cabe señalar que no se considerará como criterio de exclusión la ausencia de alguno de los desenlaces previamente señalados.

Los datos de ensayos clínicos aleatorizados se extraerán de las revisiones sistemáticas. Se excluirán estudios primarios (observacionales y experimentales) y revisiones no sistemáticas de la literatura (*scoping reviews*, revisiones narrativas, entre otras).

ESTRATEGIA DE BÚSQUEDA: IDENTIFICACIÓN DE LOS ESTUDIOS

Bases de datos: Se realizarán búsquedas en las bases de datos **MEDLINE** (a través de Ovid), **Embase** (a través de Elsevier), **PsycInfo** (a través de Ebsco), y **CENTRAL** (a través de Cochrane Library). La búsqueda no será restringida por fecha, lugar de publicación ni idioma. Para aumentar su sensibilidad, la estrategia de búsqueda será diseñada para recuperar estudios que incluyan participantes de cualquier edad, sexo, origen étnico o gravedad de la enfermedad.

Periodo de tiempo de la búsqueda: Las estrategias buscarán estudios publicados desde el tiempo de origen de cada base de datos hasta agosto del 2020. A pesar de que en el llamado a licitación se contemplaba una búsqueda de los últimos 10 años, en una reunión sostenida con la contraparte ministerial y miembros de ETESA, se acordó quitar el límite temporal, para evitar la posibilidad de omitir trabajos utilizables publicados antes del 2010.

Filtros: Para la recuperación de ensayos clínicos aleatorizados en las distintas bases de datos, se emplearán los siguientes filtros de búsqueda validados por Cochrane y por la *Health Information Research Unit* de la *University of McMaster*:

1. Cochrane Highly Sensitive Search Strategy for identifying randomized trials in MEDLINE: sensitivity- and precision-maximizing version (2008 revision); Ovid format. Disponible en: https://handbook-5-1.cochrane.org/chapter_6/6_4_11_search_filters.htm
2. HIRU McMaster, Maximizes specificity for systematic reviews. Disponible en: https://hiru.mcmaster.ca/hiru/HIRU_Hedges_MEDLINE_Strategies.aspx#Reviews

Términos y estrategias de búsqueda: En la siguiente tabla se detallan las estrategias de búsqueda ejecutadas (y las fechas) en las distintas bases de datos electrónicas.

<p>MEDLINE (vía Ovid) Fecha: 03.08.2020</p>	<p>Ovid MEDLINE(R) and Epub Ahead of Print, In-Process & Other Non-Indexed Citations, Daily and Versions(R) 1946 to August 03., 2020</p> <p>1 Child Development Disorders, Pervasive/ 2 (pervasive development* disorder* OR PDD OR PDDs).ti,ab. 3 Rett*.ti,ab. 4 Asperger*.ti,ab. 5 (autis* OR ASD OR ASDs).ti,ab. 6 Kanner*.ti,ab. 7 or/1-6 8 randomized controlled trial.pt. 9 controlled clinical trial.pt. 10 randomized.ab. 11 placebo.ab. 12 clinical trials as topic.sh. 13 randomly.ab. 14 trial.ti. 15 8 or 9 or 10 or 11 or 12 or 13 or 14 16 exp animals/ not humans.sh. 17 15 not 16 18 (MEDLINE or systematic review).tw. or meta analysis.pt. 19 7 and 18 20 7 and 17 21 19 or 20</p>

CRIBADO, ELEGIBILIDAD Y SELECCIÓN DE LOS ESTUDIOS

Primera etapa: Evaluación de la elegibilidad de los estudios.

Dos autores revisarán de forma independiente (sin conocer el juicio del otro) los títulos y resúmenes (o *abstracts*) de los estudios obtenidos, luego de eliminar duplicados, y seleccionarán aquellos estudios potencialmente elegibles, según los criterios anteriormente señalados. Las discrepancias serán resueltas por un tercer autor. Dicho proceso se llevará a cabo en la plataforma Rayyan (<https://rayyan.qcri.org>).

Segunda etapa: Selección de los estudios incluidos.

De los estudios potencialmente elegibles, se obtendrán los artículos a texto completo para una segunda revisión, que será llevada a cabo por dos revisores de modo independiente, que decidirán la inclusión o exclusión de los estudios tras una revisión en detalle, consignando la razón de la decisión—basada en los criterios anteriormente descritos. La resolución de discrepancias estará a cargo de un tercer autor.

RECOLECCIÓN DE DATOS Y ANÁLISIS

Extracción de datos:

Los estudios seleccionados se ingresarán a un formulario de extracción de datos (elaborado en Google Sheets, Google LLC). Para esta etapa se realizará un pilotaje en donde seis autores discutirán la adopción de criterios consensuados. Los datos a extraer se pueden apreciar en la primera fila del **Anexo a**.

Evaluación de la calidad metodológica de los estudios incluidos:

Dos autores, de manera independiente, analizarán la calidad metodológica de las revisiones sistemáticas incluidas utilizando la herramienta AMSTAR 2 [2]. En caso de discrepancia, la valoración final la resolverá un tercer autor. Para esta etapa se realizará un pilotaje en donde seis autores discutirán la adopción de criterios consensuados.

En cuanto a la evaluación del riesgo de sesgo de los estudios primarios incluidos en las revisiones sistemáticas, se utilizarán los juicios emitidos por los autores originales de las revisiones sistemáticas incluidas, si están disponibles.

SÍNTESIS DE LOS RESULTADOS

Los hallazgos serán extraídos de acuerdo a las características de la población, intervención, comparación y desenlaces críticos en tablas de resumen; priorizando los hallazgos de las revisiones sistemáticas más exhaustivas para cada pregunta clínica, según AMSTAR 2.

A modo de mapear el cuerpo de la evidencia en torno a las intervenciones para niños con TEA, se construirá una matriz con las revisiones sistemáticas en las columnas y los ensayos clínicos incluidos en las filas.

Si está disponible, para cada desenlace se reportará la certeza de la evidencia según el *Grading of Recommendations, Assessment, Development and Evaluation* (GRADE) [3] realizada por los autores originales de las revisiones sistemáticas incluidas.

Nuestros métodos siguen los lineamientos propuestos en el *Preferred Reporting Items for Systematic Reviews and Meta-Analyses* (PRISMA) *checklist* [4].

RESULTADOS

Se encontró un total de 15469 artículos. Tras la eliminación de duplicados, se obtuvieron 9799 documentos a cribar. 2092 fueron los artículos potencialmente elegibles que resultaron del cribado. Después de una segunda ronda de de-duplicación, se descartaron 71 artículos (*preprints*, versiones previas publicadas de las revisiones, registro de protocolos, protocolos publicados, *proceedings* de congresos, entre otros).

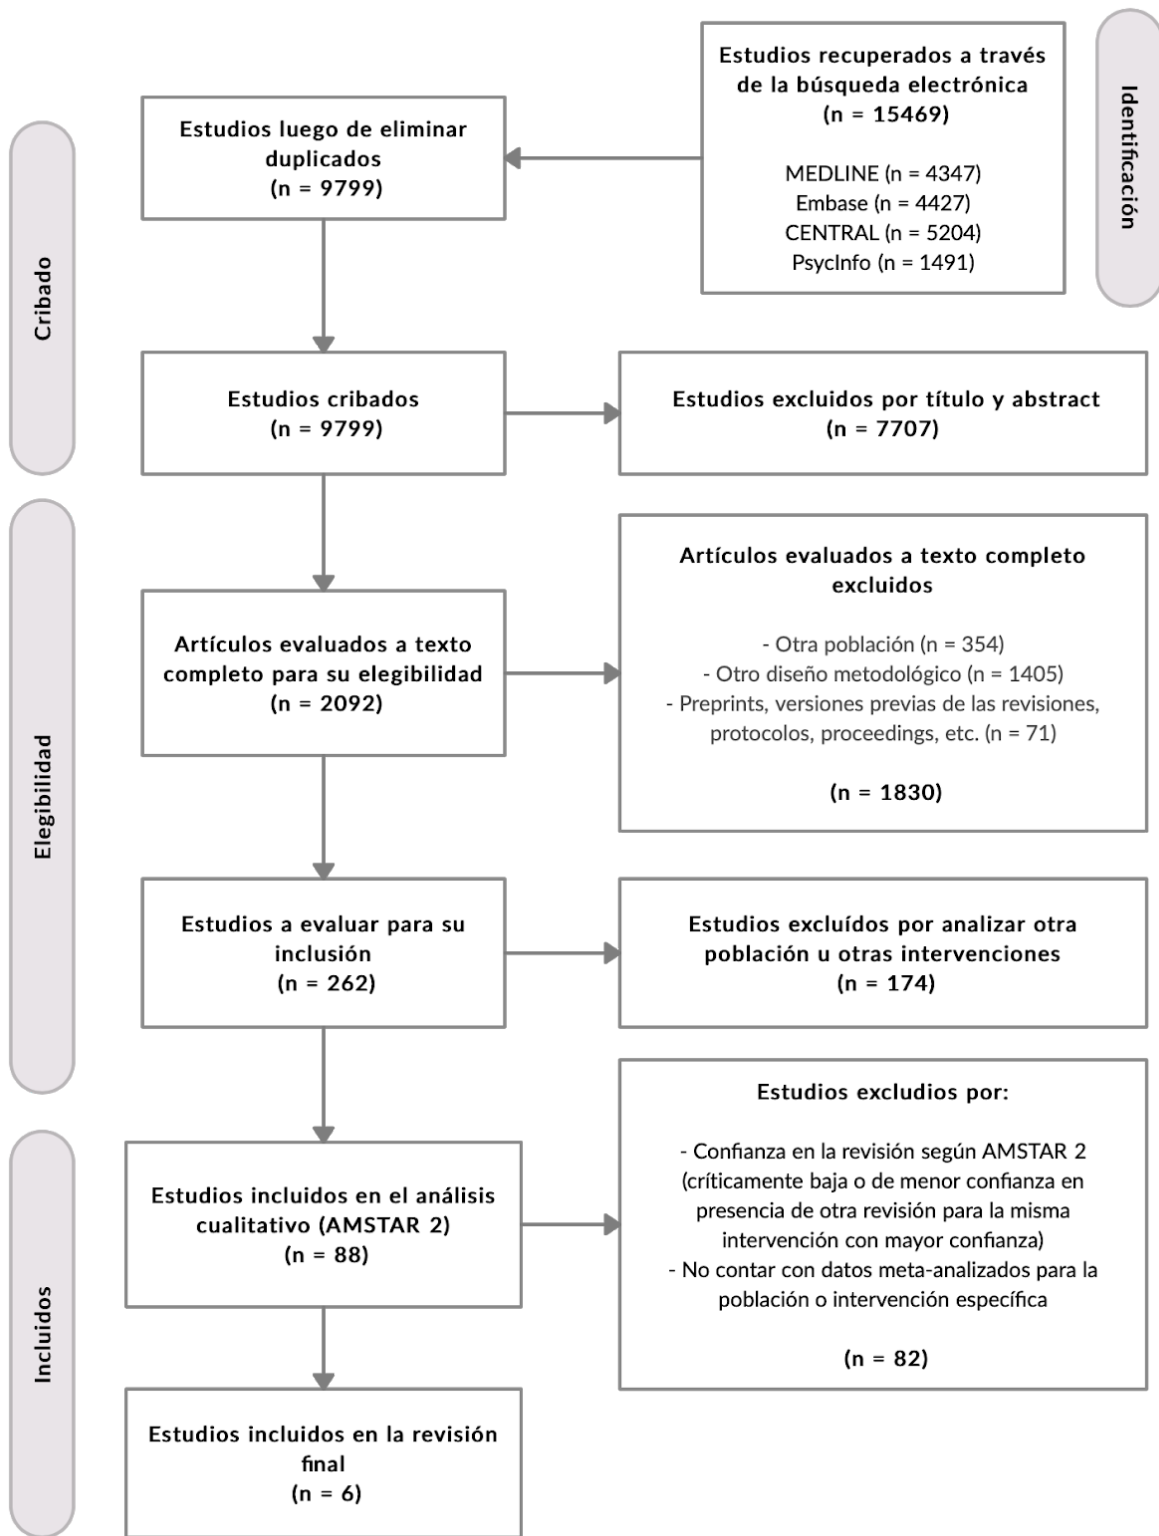

Luego de analizar los 2021 artículos potencialmente elegibles a texto completo, se encontraron 262 revisiones sistemáticas que evaluaron el uso de intervenciones farmacológicas y no farmacológicas de interés (Ver informe 1, sección Métodos) en una población infantil que incluía a pacientes con trastorno del espectro autista.

En relación a la población de pacientes de interés y a las intervenciones tanto farmacológicas como no farmacológicas a analizar (ver **Informe 1**), se identificaron de forma preliminar 88

reportes (16 de aripiprazol, 30 de risperidona y 42 de intervenciones no farmacológicas) como revisiones sistemáticas que cumplirían con los criterios de inclusión de la presente revisión.

En la **Figura 1** presentamos el PRISMA *flowchart* que muestra el detalle de los resultados descritos previamente. En los anexos se presenta mayor detalle de los estudios incluidos en el análisis final (**Anexo 1**), de los excluidos del análisis final (**Anexo 2**), y de los estudios potencialmente elegibles que no cumplieron con los criterios de inclusión (**Anexo 3**).

Figura 1. PRISMA flowchart

A continuación se detallan los hallazgos de los estudios incluidos.

ARIPIPAZOL

Se identificaron preliminarmente 16 reportes como revisiones sistemáticas de las cuales se excluyó a 4 estudios (dos no incluyeron la droga de estudio, una revisión narrativa y una revisión que fue reemplazada por una versión más actualizada). Finalmente analizamos 12 revisiones sistemáticas con la herramienta AMSTAR 2 de las cuales: 10 fueron valoradas con una confianza críticamente baja, una con una confianza baja y una con una confianza alta. Se incluyen los resultados de la revisión de confianza alta [5]. No se reportan los resultados de la revisión de confianza baja [6] dado que no realiza síntesis de la evidencia disponible y reitera los hallazgos de la primera.

Hirsch 2016 (confianza en la revisión alta)

Severidad de los síntomas de autismo

El aripiprazol reduciría en promedio en -0.57 puntos severidad de síntomas de autismo, evidenciado con la escala de Impresión Clínica Global (CGI) [7] en comparación a placebo a las 8 semanas (IC 95% -0,96 a -0,18, dos estudios). Certeza de la evidencia GRADE no estimada.

Comportamiento repetitivo o restrictivo

El aripiprazol reduciría en promedio -2.66 puntos en la subescala de estereotipia del *Aberrant Behaviour Checklist* (ABC) [8] en comparación al placebo a las 8 semanas (IC 95% -3,55 a -1,77; dos estudios). Certeza de la evidencia GRADE moderada.

Procesamiento sensorial

(sin información)

Lenguaje

El aripiprazol reduciría en promedio -1,43 puntos en la subescala de Lenguaje Inapropiado del *Aberrant Behaviour Checklist* (ABC) [8] en comparación al placebo a las 8 semanas (IC 95% -2,60 a -0,27; dos estudios). Certeza de la evidencia GRADE no estimada.

Comunicación social

(sin información)

Funcionamiento social

(sin información)

Problemas de comportamiento

El aripiprazol reduciría en promedio -6,17 puntos en la subescala de Irritabilidad del *Aberrant Behaviour Checklist* (ABC) [8] en comparación al placebo a las 8 semanas (-9,07 a -3,26; dos estudios). Certeza de la evidencia GRADE moderada.

Habilidades de la vida diaria

(sin información)

Eventos adversos

El aripiprazol causaría un aumento significativo de peso (RR 3,78; IC 95% 1,78 a 8,02) con un aumento promedio de 1,13 kg en relación a placebo a las 8 semanas (IC 95% 0,71 a 1,54; dos estudios; certeza GRADE moderada; tamaño de efecto Cohen's $d=3,1$), como así también un aumento en la sedación (RR 4,28; IC 95% 1,58 a 11,60; certeza GRADE moderada), temblor (RR 10,26; IC 95% 1,37 a 76,63; certeza GRADE moderada).

RISPERIDONA

Se identificaron preliminarmente 30 reportes como revisiones sistemáticas de las cuales se excluyó a 14 estudios (cuatro no incluyeron la droga de estudio, una revisión narrativa, dos eran resúmenes con escasos datos, tres evaluaban la risperidona como co-intervención, una era una guía clínica, una era un estudio primario no relevante, una no era en niños y una era un overview). Finalmente analizamos 16 revisiones sistemáticas con la herramienta AMSTAR dos de las cuales: 14 fueron valoradas con una confianza críticamente baja y dos con una confianza baja. Se incluyen los resultados de una de las revisiones de confianza moderada [9]. No se reportan los resultados de la segunda revisión de confianza baja [6] dado que no realiza síntesis y redunda en hallazgos con la revisión seleccionada.

Maneeton 2018 (confianza en la revisión moderada)

Severidad de los síntomas de autismo

La risperidona reduciría en promedio -4,62 puntos en la escala CARS de severidad en comparación al placebo a los seis meses (IC 95% 7,84 a 1,40; dos estudios; certeza GRADE no estimada).

La escala utilizada para medir severidad de síntomas de autismo fue *Childhood Autism Rating Scale* (CARS) [10].

Comportamiento repetitivo o restrictivo

La risperidona reduciría en promedio -2,58 puntos en la subescala de Estereotipia del *Aberrant Behaviour Checklist* (ABC) [8] en comparación al placebo a las 6-8 semanas (IC 95% -3,74 a -1,41; presumiblemente tres estudios; certeza GRADE no estimada).

Procesamiento sensorial

(sin información)

Lenguaje

La risperidona reduciría -1,08 puntos en la subescala de Lenguaje Inapropiado del *Aberrant Behaviour Checklist* (ABC) [8] en comparación al placebo a las 6-8 semanas (IC 95% -2,06 a -0,10; presumiblemente tres estudios; certeza GRADE no estimada)

Comunicación social

(sin información)

Funcionamiento social

La risperidona reduciría -3,11 puntos en la subescala ABC de retraining social en comparación al placebo a las 6-8 semana (IC -5,28 a -0,94; presumiblemente tres estudios; certeza GRADE no estimada).

La escala utilizada para medir este resultado fue la subescala de Retraining Social del *Aberrant Behaviour Checklist* (ABC) [8].

Problemas de comportamiento

La risperidona produciría una mayor tasa de respuesta que el placebo a las 6-8 semanas medida como una reducción del 25% o mayor en la subescala ABC de irritabilidad (RR 2,57; IC 95% 1,35 a 4,86; NNT de 2,3 con IC 95% 1,8 a 3; tres estudios; certeza GRADE no estimada). La risperidona reduciría -8,50 puntos en la subescala ABC de irritabilidad en comparación al placebo a las 6-8 semanas (-11,99 a -5,00; tres estudios; certeza GRADE no estimada).

La escala utilizada para medir este resultado fue la subescala de irritabilidad del *Aberrant Behaviour Checklist* (ABC) [8].

Habilidades de la vida diaria

(sin información)

Eventos adversos

La risperidona causaría un aumento significativo de eventos adversos (RR 2,64; IC 95% 1,76 a 3,96), incluyendo sedación, somnolencia, fatiga, ansiedad, hipersalivación y elevación de los niveles de prolactina. También produciría un aumento significativo del apetito (RR 2,64; IC 95% 1,76 a 3,96)

INTERVENCIONES NO FARMACOLÓGICAS

Se identificaron preliminarmente 42 reportes como revisiones sistemáticas, de las cuales se excluyeron 9 (seis no presentaron datos sobre el tamaño de efecto de alguna intervención específica—i.e., revisiones sistemáticas que en un único forest plot congregaron resultados de más de una intervención sin análisis de subgrupos que permitiera extraer datos de interés—; y tres incluían a pacientes de un rango etario más amplio que el de interés, sin incluir análisis de subgrupos que permitiera distinguir resultados de la población objetivo, i.e., ≤12 años).

Así, analizamos un total de 33 revisiones sistemáticas con la herramienta AMSTAR 2, de las cuales 28 fueron valoradas con una confianza críticamente baja, tres con una confianza baja, y dos con confianza alta. De las cinco revisiones sistemáticas que no calificaron con una confianza críticamente baja, dos [11][12] evaluaban la intervención *Early intensive behavioral intervention* (EIBI), una [13] la intervención *Applied Behaviour Analysis* (ABA), una [14] las *Naturalistic Developmental Behavioural Interventions* (NDBI), y otra [15] las intervenciones *Picture Exchange Communication System* (PECS) y *Focused Playtime Intervention* (FPI). En el caso de la intervención *Early intensive behavioral intervention* (EIBI), se reportan los resultados extraídos de la revisión que aporta con la mayor confianza, que en este caso se trata de una revisión de confianza alta [11].

A continuación se presentan los hallazgos para cada revisión sistemática incluida, según los desenlaces (o *outcomes*) de interés.

***Early intensive behavioral intervention* (EIBI)**

Reichow B 2018 [11] (confianza en la revisión alta)

Severidad de los síntomas de autismo

EIBI reduciría en promedio -0,34 desviaciones estándar en la escala *Autism Diagnostic Interview - Revised* (ADI-R) [16] o *Autism Screening Questionnaire* (ASQ) [17] en comparación a control, a los 24 meses de iniciado el tratamiento (IC 95% -0,79 a 0,11; dos estudios [81 pacientes]). Certeza de la evidencia GRADE muy baja.

Comportamiento repetitivo o restrictivo

(sin información)

Procesamiento sensorial

(sin información)

Lenguaje (expresivo)

Existe una diferencia de medias estandarizada de 0,51 desviaciones estándar a favor de EIBI en relación al grupo control, a los 24 a 36 meses del tratamiento (IC 95% 0,12 a 0,90; cuatro estudios [165 pacientes]). Certeza de la evidencia GRADE baja.

Las escalas utilizadas para medir lenguaje expresivo en los estudios incluidos en esta revisión, fueron:

Expressive One-Word Picture Vocabulary Test - Revised (EOWPVT-R) [18], *Reynell Developmental Language Scales (RDLS)* [19], *Infant-Toddler Language Scale (ITLS)* [20], *Receptive Expressive Emergent Language scales - Revised (REEL-R)* [21], *Preschool Language Scale - 3rd Edition (PLS-3)* [22], *Expressive Vocabulary Test (EVT)* [23] y *Developmental Profile (DP-II)* [24].

Comunicación social

(sin información)

Funcionamiento social

EIBI aumentaría en promedio 6,56 puntos la subescala de socialización de la *Vineland Adaptive Behavior Scale (VABS)* [25] en comparación a control, a los 24 a 35 meses de iniciada la intervención (IC 95% 1,52 a 11,61; cinco estudios [201 pacientes]). Certeza de la evidencia GRADE no evaluada.

Problemas de comportamiento

La intervención EIBI mejoraría los problemas de comportamiento reduciendo en -0,58 desviaciones estándar respecto al grupo control, a los 24 a 36 meses (IC 95% -1,24 a 0,07; dos estudios primarios [67 pacientes]). Certeza de la evidencia GRADE muy baja.

Las escalas utilizadas fueron: *Child Behavior Checklist (CBCL)* [26]; *Developmental Behavior Checklist (DCB)* [27].

Habilidades de la vida diaria

La intervención EIBI aumentaría 9,58 puntos en la escala *Vineland Adaptive Behavior Scale (VABS)* dimensión habilidades de la vida diaria [25], en comparación con control a los 24 a 36 meses (IC 95% 5,57 a 13,60; cinco estudios [201 pacientes]). Certeza de la evidencia GRADE no evaluada.

Applied Behaviour Analysis (ABA)

Virués-Ortega 2010 [13] (confianza en la revisión baja)

Severidad de los síntomas de autismo

(sin información)

Comportamiento repetitivo o restrictivo

(sin información)

Procesamiento sensorial

(sin información)

Lenguaje (expresivo)

La intervención ABA aumentaría en promedio 1,47 desviaciones estándar las escalas de lenguaje expresivo en comparación a control, tiempo de seguimiento no reportado (IC 95% 0,85 a 2,08; diez estudios primarios [164 pacientes]). Certeza de la evidencia GRADE no evaluada.

Las escalas utilizadas por los estudios incluidos, fueron: *Systematic Behavioral Observation* (Expressive BO) [13]; *Reynell Developmental Language Scales* (RDLS) [19]; *British Picture Language Scale* (BLPS-II) [28]; *Clinical Evaluation of Language Fundamentals* (CELF-III) [29].

Comunicación social

La intervención ABA aumentaría en 1,45 puntos en la subescala de socialización de VABS, en comparación con control a los 24 a 35 meses [IC 95% 0.02, 1.88] metaanálisis de efectos aleatorios, once estudios (301 pacientes) certeza de la evidencia no evaluada con GRADE.

Escala utilizada: VABS *Vineland Adaptive Behavior Scales*, dominio communication [25].

Funcionamiento social:

La intervención ABA aumentaría en 0,95 puntos la subescala de socialización de VABS, en comparación con control a los 24 a 35 meses [IC 95% 0.53, 1.37] metaanálisis de efectos aleatorios, once estudios (301 pacientes) certeza de la evidencia no evaluada con GRADE.

Escala utilizada: VABS *Vineland Adaptive Behavior Scales*, dominio socialización [25].

Problemas de comportamiento

(sin información)

Habilidades de la vida diaria

La intervención ABA aumentaría 0,62 puntos en la escala VABS, dimensión socialización, en comparación con control a los 24 a 36 meses [IC 95% 0,30, 0.93] metaanálisis de efectos aleatorios, diez estudios (301 pacientes) certeza de la evidencia no evaluada con GRADE.

Escala utilizada: VABS *Vineland Adaptive Behavior Scales* [25]; VABS *daily living skills domain* [25].

Intervenciones basadas en apoyos visuales: *Picture Exchange Communication System* (PECS)

Brignell A 2018 [15] (confianza en la revisión alta)

Severidad de los síntomas de autismo

(sin información)

Comportamiento repetitivo o restrictivo

(sin información)

Procesamiento sensorial

(sin información)

Lenguaje (expresivo)

Los participantes en el grupo de la intervención PECS iniciarían comunicación verbal y no verbal (evento medido en veces por minuto) 2,73 veces (OR 2,73; IC 95% 1,22 a 6,08) más que los participantes del grupo control, a los 7,5 a 10,7 meses. Un estudio (84 pacientes). Certeza de la evidencia GRADE muy baja.

Comunicación social

Por cada 100 participantes que en el grupo control tuvieran el evento interacción social recíproca (contado como cambio en las subescalas «comunicación» o «interacción social recíproca» del ADOS-G [30]), 55 participantes en el grupo intervenido con PECS lo harían (OR 0,55; IC 95% 0,25 a

1,19; p=0,13). Desenlace medido a los 7,5 a 10,7 meses. Un estudio (84 pacientes). Certeza de la evidencia GRADE muy baja.

Funcionamiento social

(sin información)

Problemas de comportamiento

(sin información)

Habilidades de la vida diaria

(sin información)

Focused Playtime Intervention (FPI)

Brignell A 2018 [15] (confianza en la revisión alta)

Severidad de los síntomas de autismo

(sin información)

Comportamiento repetitivo o restrictivo

(sin información)

Procesamiento sensorial

(sin información)

Lenguaje (expresivo)

No hubo diferencias significativas entre el grupo intervenido con FPI y el grupo control (p=0,23) a las 20 a 21 semanas. Un estudio (70 pacientes), certeza de la evidencia GRADE muy baja.

Escala utilizada: *Mullen Scale of Early Learning: Expressive Language Index, log (base 2) transformed age equivalent scores (MSEL)* [31].

Comunicación social

(sin información)

Funcionamiento social

(sin información)

Problemas de comportamiento

(sin información)

Habilidades de la vida diaria

(sin información)

Intervenciones naturalísticas: *Naturalistic Developmental Behavioural Interventions (NDBI)*

Tiede G 2019 [14] (confianza en la revisión baja)

Severidad de los síntomas de autismo

Las intervenciones naturalísticas (i.e., PRT, ESDM, LEAP, JASPER y JA/Imitation) reducirían en promedio -0,38 desviaciones estándar en comparación a control (IC 95% -0,71 a -0,04; nueve

estudios [número de participantes no reportado]). Certeza de la evidencia GRADE no evaluada.

Las escalas utilizadas para medir severidad de los síntomas de autismo, fueron: *Autism Diagnostic Observation Schedule Calibrated Severity Score (ADOS-CS)* [30]; *Social Communication Questionnaire (SRS)* [32], *Childhood Autism Rating Scale (CSRS)* [10]; *Latent factor derived by authors from multiple measures (Composite ACS)* [14]; *Social Communication Questionnaire (SCQ)* [17].

Comportamiento repetitivo o restrictivo

(sin información)

Procesamiento sensorial

(sin información)

Lenguaje (expresivo)

A favor de las intervenciones NDBI (i.e., ESI, ESDM, JASPER, LEAP, Parent Training y JA/Imitation) existiría una diferencia de medias estandarizada de 0,32 desviaciones estándar en comparación a control (IC 95% 0,07 a 0,56; doce estudios [número de participantes no reportado]). Certeza de la evidencia GRADE no determinada.

Las escalas utilizadas para medir lenguaje expresivo en los estudios primarios, fueron: *Preschool Language Scales, 4th Edition (PLS-4)* [33]; *Communication and Symbolic Behavior Scales (CSBS)* [34]; *Mullen Scales of Early Learning Developmental Quotient (Mullen DQ)* [31]; *Autism Diagnostic Observation Schedule six-point scale derived from total language items (ADOS language)* [30]; *MacArthur Communicative Developmental Inventory (MacArthur)* [35]; *Mullen Scales of Early Learning standard T-score (Mullen T-Score)* [31]; *Mullen Scales of Early Learning age equivalence (Mullen AE)* [31]; *Reynell Developmental Language Scales* [19].

Comunicación social

Las intervenciones NDBI (i.e., JASPER y Focus) tendrían un efecto significativo sobre la comunicación social (SMD=0,65; IC 95% = 0,37 a 0,93).

Las escalas utilizadas para medir comunicación social fueron: *Parent Child Interaction joint engagement (PCX JE)* [14]; *Teacher child interaction joint engagement (TXC JE)* [14]; *Erikson Scales non-avoidance score (ES-NA)* [14].

Funcionamiento social

(sin información)

Problemas de comportamiento

(sin información)

Habilidades de la vida diaria

No se encontró un efecto significativo de las NDBI (i.e., ESDM y JA/Imitation) sobre las habilidades de la vida diaria (SMD = 0,09; IC 95% = -0,24 to 0,42); cinco estudios, [número de participantes no reportado]). Certeza de la evidencia GRADE no evaluada.

Las escala utilizadas para medir este desenlace, fueron: *Vineland Adaptive Behavior Scales (VABS)* [25]; *VABS daily living skills domain* [25].
